

**PATENT PENDING**

<http://www.hansenseagleeye.com>

These shooting glasses are intended for use when shooting a scoped rifle , pistol , or bow. With only one bifocal carefully located near the nose bridge area in the aiming eye lens only ,they enable the user to obtain a clear sight picture at the scope with a slight natural turn of the head, and distance viewing is unimpeded.

Some hunters resort to putting on and taking off their reading glasses. Others try using their normal bifocals by tilting their head back and turning it and adjusting their eyes. Hansen's Eagle Eye Shooting Glasses solves those inconveniences. They can be left on during the hunt since distance viewing is not affected, and they won't distort the ground beneath you and cause you to trip as with normal bifocals.

Options available include nonprescription lenses with a standard bifocal of 1.75, 2.00, and 2.5 with gun metal aviator frames tinted light amber, or medium grey. Full prescription models in black matte aviator frames, also tinted amber or grey. All prescription orders must be accompanied by a valid prescription.
